

HomeTest – Health Service Kit application material

Applicant: individual developer (Huawei ID hid83017893). App: HomeTest (Android), package com.astoramor.apptestsmedicos, AppGallery Connect App ID 119155453. Prepared on 2 October 2026 following the structure of “Application Material V3.1”.

1. Data Usage

Permissions	Data usage scenarios and requirements	Data usage purpose	Development completion date	Remarks
Read step count data	After the user connects Huawei Health from the Wearables screen and authorises access, the app reads daily step totals and shows them in the user's own dashboard: a daily ring on the Today screen and a 14-day trend chart in My Data. Data is classified by day.	Help users understand their daily activity next to their blood test results and track a personalised step goal (e.g. 8,000 steps/day) that is part of their preventive-health plan.	2026.11.30	Read-only. The app never writes data to Huawei Health.
Read calories burned (active energy) data	Daily active calories are shown in a ring on the Today screen (daily readiness section) and as a 14-day trend in My Data.	Give users a simple view of their daily energy expenditure alongside their other health indicators.	2026.11.30	Read-only.
Read distance data	Daily distance complements step count in the activity summary.	Contextualise daily activity (steps vs. distance) for the user.	2026.11.30	Read-only.
Historical data (one month, read-only)	On first connection the app reads up to the previous month of step, calorie and distance data, so the user sees a baseline and recent trends from day one instead of empty charts. Longer trends are built afterwards from the data read day by day while the connection is active.	Give the user an immediate starting point for their activity goal and the 14-day / 1-month charts. It is not used for any other purpose.	2026.11.30	Only after explicit user authorisation; limited to one month.

Data handling. Data is stored in the European Union (Supabase, Frankfurt), protected by row-level access control so each user only sees their own data, and is never sold or used for advertising. The user can disconnect Huawei Health and delete their account at any time. Data is only shared with a healthcare professional if the user explicitly grants it per data category, and the user can revoke it at any time. OAuth tokens are kept server-side, never in the mobile app.

Screenshots of the app simulation. Can be provided on request (Today screen with the daily readiness and activity rings; My Data screen with 14-day trends; Wearables connection screen).

2. Company Description

Item	Answer
2.1.1 Has the company legally existed for more than 1 year?	Not applicable. The application is submitted as an individual developer. The company that will operate HomeTest is being incorporated in Spain (EU). Only basic-openness data is requested.
2.1.2 Registered paid-up capital	Not applicable (individual developer).
2.1.3 Brief introduction	HomeTest is an early-stage preventive-health project based in Madrid, Spain. It combines at-home blood tests, a mobile app to understand the results, and access to independent healthcare professionals (doctors, dietitians, trainers).
2.2 Corporate information	Individual developer: Astor García Amor. Country: Spain.

3. Project Details

Item	Answer
1. Application introduction	HomeTest is a preventive-health membership app. Users record and understand their blood test results (extracted from their lab reports), home measurements (glucose, blood pressure), wellbeing check-ins and daily activity from their wearables. The app shows trends and informational wellbeing recommendations (it does not diagnose) and lets users share selected data categories with the professionals they choose. Huawei Health data (steps, calories, distance) is used to show daily activity and personal trends in the user's own dashboard.
2. Application industry	Health and fitness / preventive healthcare (consumer).
3. Project leader for Huawei-side connection	Astor García Amor (developer).
4. Cooperation details	Read-only integration of Health Service Kit basic data via cloud REST APIs with user OAuth authorisation.
5. Purchasing needs	No.

4. Technical Self-test

Item	Answer
Countries this app serves	Spain (European Union).
Commercial release or Demo	Demo / pre-release testing (commercial release planned after company incorporation).
Application types that will access Health Service Kit	Android mobile app.
Open technical integration	Cloud-side REST APIs (read-only), OAuth 2.0 with Huawei ID; tokens stored server-side.
Historical data range requested	One month.
